

Reconstructive Foot & Ankle Surgery

Reconstructive foot and ankle surgery seeks to relieve the pain and discomfort caused by injury, congenital abnormalities, infection, arthritis, and even improper, narrow footwear. It also aims to restore or improve function and stability. Reconstructive surgical procedures are complex and can involve repairing or transferring tendons, implanting joints, removing tumors, and cutting, grafting, or fusing bone. During reconstruction, internal and external fixation devices including pins, screws, staples, and wires as well as casts may be used for repair and stabilization.

Forefoot

- Bunions
- Toe Deformities
- Neuroma

Midfoot

- Arch Problems
- Osteoarthritis

Hindfoot

- Adult Flatfoot
- Osteoarthritis
- Deformity

Ankle

- Arthroscopic Surgery
- Ankle and Hind Foot Arthritis
- Congenital Anomalies
- Paralytic Reconstruction
